Novel regulatory or unfolding peptides of ezrin that binds to Hepreceptor, useful for inducing immune response for treating infectious diseases and cancer.

Claim 5; Page 36; 42pp; English.

The present sequence is domain B of human hepreceptor of human ezrin. The hepreceptor is a novel active site in human ezrin. Bzrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see AAB82041) that bind to hepreceptor with greater affinity than HBPL (see AAB82046). The hepreceptor binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present sequence assembles into two anti-parallel

```
cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased that effect the activity of P by expression in a patient's genome that effect the activity of P by expression is patient's genome to produce the colon cancer-associated Ps. Ps y inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinoms and cancers. AAH37196 to AAH37204 and AAH37789 represent

2 sequences used in the exemplification of the present invention. N.B.

2 pages 666 to 682 and page 7053 of the sequence listing were missing at the others.

2 time of publication, meaning no sequences are present for SEQ ID NO:1027

The invention relates to 971 novel human cDNA sequences (ADC29919-CC ADC30890-ADC31860). The invention also relates to notice acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a mucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody companies or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of polypeptide of the invention. The invention further discloses methods of polypeptide of the invention. The invention methods for the identification of compounds that modulate the companies of monoclonal antibodies for carrying out the methods of the invention of conting sequences corresponding to the cDNA sequences of the invention or expression or activity of the polymuclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention are corresponding to the cDNA sequences of the invention are contiguated of multiple and polypeptides of the invention are contiguated of multiple and configurations responsible for garetic disorders or other configurations responsible for garetic disorders or other craits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynuclectide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention discloses a composition comprising two or more isolated rat derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in sequence which is differentially expressed in a method for identifying a
             disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The mucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmet directly from WIPO at fip. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

         polymprolectides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more pain and a pharmaceutical composition comprising the one or more modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "the Tyr at this position can be mutated (preferably to a Phe) to construct an ezrin mutant of the invention"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides a pharmaceutical composition containing ezrin protein, RNA or DNA mutated on tyrosine 353, or a functional fragment or derivative of the ezrin mutant. The new composition is useful for prevention and/or treatment of tumors, and especially metastasis. The present sequence represents the amino acid sequence of human ezrin (before the maturation by deletion of the first amino acid Met)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition for prevention and treatment of tumors and metastasis.
                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                             .

useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other trains. For assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, anaemia, platelat disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptiace are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence of data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the print of the print

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention; methods for the indentification of compounds that modulate the invention; methods for the indentification of compounds that modulate the invention; methods for the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention (ADC31861-ADC32827) and the polypeptides encoded by the contigs (ADC33628 ADC33394). The nucleic acids and polypeptides of the invention are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

```
The invention relates to novel human secreted polypeptides. The polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
                                                                                                                                                                                                                               Human, vaccination, gene therapy, nutritional supplement, stem cell proliferation, haematopoiesis, nerve tissue regeneration; immune suppression, immune stimulation, anti-inflammatory, leukaemia.

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to mucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody polynucleotides or polypeptides of the invention; and method of detecting polynucleotides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or
             as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, diagnostic; drug screening; forensics; gene mapping; biodiversity assessment; Parkinson's disease; Alzheimer's disease; biodiversity disease; anaemia; platelet disorder; wound; burns; ulcers; osteoporosis; autoimmune disease; cancer; molecular weight marker; food supplement; antiparkinsonian; nootropic; antiparemic; anticoagulant; thrombolytic; vulnerary; antitucer; osteopathic; immunosuppressive; antiinfammatory; cytostatic; gene therapy; chromosome 6q2s.2-26.
are useful in genetic vaccination, testing and therapy, and can be used
                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Wehrman T;

invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polynuclectide probes and/or monoclonal antibodies for carrying out the methods of the cinvention; methods for the identification of compounds that modulate the expression or activity of the polynuclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention of (ADC31364). The nucleic acids and polypeptides of the invention are caseful in diagnostics, drug screening, forensics, gene mapping, in the contists, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's concer. The nucleic acids may also besed as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically contained human polypeptide sequence of the invention. Note: The sequence data for this patent did not forme darker by from WIPO at

                                                                          called human colon cancer antigens, given in AAB52234 to AAB5406. The human colon cancer antigens can have cytostatic, cardioactive, muscular, neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, infectious diseases, and cardiovascular disorders, infectious diseases; and cardiovascular disorders infectious diseases; and cardiovascular disorders. AAC98772 and AAB54007 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel regulatory or unfolding peptides of ezrin that binds to Hepreceptor, useful for inducing immune response for treating infectious diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see ABB2021 to AAB82046) that bind to hepreceptor with greater affinity than HEPI (see AAB82046). The hepreceptor binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present peptide binds to domains A and B of the

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to abstrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation, to regulate haematopolesis; and in bone, cartilage, tendon and/or retreate stem tell almamatory agents; and in treatment of leukaemias. AUC29510-AAU33304 represent the amino acid sequences of novel human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
                                                                                                                                    Human, vaccination; gene therapy, nutritional supplement,
stem cell proliferation; haematopoiesis; nerve tissue regeneration;
immune suppression; immune stimulation; anti-inflammatory; leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see AAB82021 to AAB82041) that bind to hepreceptor with greater affinity than HEP1 (see immune response, and for binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present peptide binds to domain A of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human Breast cancer-associated protein isoform, BPI-1 peptide #3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see AABS2021 to AABS2041) that bind to hepreceptor with greater affinity than HEPI (see AABS2046). The hepreceptor binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present peptide binds to domain A of the hepreceptor (AABS2019)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to diagnosing, determining the stage or severity, or identifying the risk of a subject developing cancer (especially breast cancer), or monitoring the effect of therapy on a subject with cancer, comprising analysing a test sample using two-dimensional electrophoresis and detecting Breast Cancer-Associated Protein Isoforms (BPIs). The methods disclosed are used for the diagnosis and prognosis of breast cancer, for determining the severity of breast cancer, and monitoring the effect of therapy administered to a subject. Antibodies raised against the binding domain of a BPI, the binding the function of a BPI cast cancer. The methods use sensitive and specific biomarkers provide early diagnosis of breast cancer, and the compositions are more potent, specific, and has a more rapid effect with fewer side effects that other prior art methods. The present sequence is a tryptic digest peptide from a BPI of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Claim 26, Page 37; 42pp; English.

XX

Che structure of the cortical cytoskeleton to control cell surface company. The present invention relates to peptides (see AAB82021 to CAAB82041) that bind to hepreceptor with greater affinity than HEP1 (see CC topography. The present invention relates to peptides are useful for inducing CC immune response, and for treating infectious diseases, cancer and HIV-CC AAB82046). The hepreceptor binding peptides are useful for inducing CC immune response, and for treating infectious diseases, cancer and HIV-CC related dementia. The present peptide binds to domain A of the Best Local Similarity 100.0%; Pred. No. 0.41; Length 11;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 8153, Application US/09543681A

Sequence 8153, Application US/09543681A

Patent No. 6605709

GENERAL INFORMATION:
APPLICANT: GARY BRETON

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 2709.1002-001

CURRENT APPLICATION NUMBER: US/09/543,681A

CURRENT FILING DATE: 2000-04-05

PRIOR APPLICATION NUMBER: US 60/128,706

PRIOR APPLICATION NUMBER: US 60/128,706

NUMBER OF SEQ ID NOS: 8344

SEQ ID NOS: 8344
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 14059, Application US/09489039A

; Sequence 896, Application US/09925299
; Patent No. US2002055627A1
; GENERAL INFORMATION:
; TILE APPLICANT: Rosen et al.
; TILE OF INVENTION: Nucleic Acids, Proteins and Antibodies
; TILE REFERENCE: PAIO2
CURRENT APPLICATION NUMBER: US/09/925,299
; CURRENT FILING DATE: 2001-08-10
; PRIOR APPLICATION NUMBER: PCT/US00/05883
; PRIOR APPLICATION NUMBER: C0/124,270
; PRIOR PILING DATE: 1999-03-12
; NUMBER OF SEQ ID NOS: 1556
; SOFTWARE: PatentIN Ver. 2.0
; SEQ ID NO 896
; LENGTH: 635
                                                     APPLICANT: Zhang, Bing
APPLICANT: Glbson, Bradford W.
APPLICANT: Glbson, Bradford W.
APPLICANT: Glenn, Cary M.
APPLICANT: Glenn, Cary M.
APPLICANT: Warnock, Dale E.
TITLE OF INVENTION: TARGETS FOR THERAPEUTIC INTERVENTION
TITLE OF INVENTION: IDENTIFIED IN THE MITOCHONDRIAL PROTECME
FILE REFERENCE: 660088.465
CURRENT APPLICATION NUMBER: US/10/408,765A
CURRENT FILING DATE: 2003-04-04
NUMBER OF SEQ ID NOS: 3077
SOFTWARE: FREESEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 630;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 48.8%; Score 20; DB 9; Length 635; Best Local Similarity 100.0%; Pred. Function:
A. Description: represses transcription of at least eight genes required for fatty acid the biosynthesis; activates the iclR gene encoding the transcription regulator of the aceBAK A. Pathway: fatty acid metabolism
A. Note: fadR-dependent DNA binding and transcriptional activation is prevented by long controls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      R.DiRusso, C.C.

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- FUNCTION: Probably involved in connections of major cytoskeletal
structures to the plasma membrane.
-!- SUBCELLUAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Component of the microvilli of intestinal
epithelial cells.

C. I. FUNCTION: Multifunctional regulator of fatty acid metabolism.

Represes transcription of at least eight genes required for fatty

acid transport and beta-oxidation among which fadA, fadB, fadD,

fadd and fadB. Activates transcription of at least three genes

cequired for unsaturated fatty acid biosynthesis: fabA, fabB and

iclR, the gene encoding the transcriptional regulator of the

aceBAK operon encoding the synsoritional regulator of the

fadR is specifically inhibited by long chain fatty acyl-CoA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright. The comparative genomics of Salmonella enterica serovar Typhi strains Ty2

A Deng W., Liou S.-R., Plunkett G. III, Mayhew G.F., Rose D.J.,

The consequence of Salmonella enterica serovar Typhi strains Ty2

A Deng W., Liou S.-R., Schwartz D.C., Blattner F.R.,

The compounds W. Schwartz D.C., Blattner F.R., Radb, fadb, and the gene encoding the transcription of at least eight, fadb, fadb and iclR, the gene encoding the transcriptional regulator of the caceBAK operon encoding the glyoxylate shunt enzymes. Binding of fadR is specifically inhibted by long chain fatty acyl-CoA compounds (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -:- SUBUNIT: DNA polymerase III contains a core (composed of alpha, epsilon and theta chains) that associates with a tau subunit. This core dimerizes to form the POLIII' complex. PolIII' associates with the gamma complex (composed of gamma, delta, delta', psi and chi chains) and with the beta chain to form the complete DNA polymerase III complex (By similarity).
